ComplianceCopilot user guide

Detailed workflow and button reference

For SME owners and product demonstrations
25 October 2026

This guide explains how the current ComplianceCopilot app works, what its visible controls do, and how to use them in everyday business situations. It describes the implemented application rather than the original feature wish list. Repeated controls are grouped where their behavior is identical. Conditional controls are identified so that you know why a button may be absent.

All company stories, wages, preparation costs and dates in examples are illustrative. Your account uses your own saved business information. The app helps you organize and review obligations; government registration, filing, payment and legal confirmation happen outside this app.

How to use this guide

Read Sections 1 to 3 for the workflow. Use the contents to find a screen, then look for its button tables. Sections 14 to 18 explain growth, financial planning, scheduling, AI and calculators. Section 21 gives complete worked journeys.

1 What the app does

ComplianceCopilot connects your business information with legal screening, actions, dates, records and growth planning. Instead of searching through separate spreadsheets, you can see why an issue matters, what information is missing and what to do next.

The main user is an SME owner or person coordinating compliance work. An accountant, adviser or HR colleague can use an exported report to discuss the business's situation with the owner. The current interface does not include an invitation or team permission management screen; entering a responsible person's name assigns a task label, not an account or access permission.

The app uses three kinds of processing:

Part	What it actually does	Useful example
Business and rule engine	Evaluates entered facts against versioned screening rules and records explanations and missing facts.	A planned increase in employees prompts EPF, ESI and POSH reviews where relevant.
Calculators and planning solver	Performs validated arithmetic and searches for schedules within entered constraints. These tools do not require an AI key.	Compare the gross wage cost of hiring now versus staging recruitment.
Live AI assistant	Uses the configured Gemini model, authorized business context and read-only tools to explain a question conversationally.	Ask what changes if you hire 75 additional employees, then ask for a simpler explanation.

The current configured model after the latest repair is Gemini 3.5 Flash Lite, identified in configuration as gemini-3.5-flash-lite. Real authenticated requests were verified in the repair record. Availability, billing and quota still depend on Google when you use the app.

2 The workflow in simple words

The everyday flow is: create an account, describe your business, review relevant laws, inspect risks and dates, complete the real-world work, record progress, and keep business information updated.

Step	What the user does	What the app provides
1 Create a private workspace	Sign up and complete the business profile.	A saved workspace associated with the signed-in account.
2 Review the law screening	Open Applicable laws and read the reasons and missing information.	A business-specific screening outcome for each supported domain.
3 Find the next action	Open Tasks & deadlines or a priority item from the overview.	Actions, suggested documents, progress controls and timing information.
4 Plan work and resources	Use Smart compliance planning or Growth planner.	A schedule, cost projection or before-and-after comparison.
5 Do the actual work	Gather documents, consult the relevant professional and act on the appropriate official portal when necessary.	Guidance and record keeping; the app does not perform the external filing.
6 Record what happened	Save progress or submit an actual completion declaration and evidence.	An action record with dates and history.

Step	What the user does	What the app provides
7 Review changes	Save real changes to team size, turnover, workplaces or activity.	Refreshed findings, relevant task changes, alerts and business change history.

Example: Phoenix Tech Solutions has eight employees. The owner first previews a total of 50 employees in Growth planner. The app compares the screening outcomes without changing the saved count. If the business later actually reaches 50, the owner updates Business Profile & Settings and saves. That save records a real business change and reevaluates the workspace.

An actual change and a hypothetical scenario are different. Typing a scenario into chat, calculating wages or saving a planning analysis does not update the real employee count.

3 The six main sections

Sidebar button	What it opens	When to use it
Business overview	The business snapshot, action progress, priority actions, dates, growth milestones and recent signals.	Start here each working day.
Applicable laws	Screening cards with reasons, conditions, missing facts and source references.	Understand why a requirement is being reviewed.
Tasks & deadlines	Action list, calendar, registrations and Smart compliance planning.	Organize and record compliance work.
Risks & alerts	Unfinished issues, priority labels, planning shortfalls and business notices.	Decide what needs attention first.
Growth planner	Workforce and law-change simulation plus financial projections.	Preview hiring, turnover changes, branches and exports.
Ask Copilot	Live chat, conversation history and a tab for tax and contribution tools.	Ask a question about the business or a related requirement.

The Business records area also contains Calendar, Registrations & licenses and Change history shortcuts. They open the same underlying records used by the main sections. The highlighted sidebar item shows your current section. On mobile, use the menu icon to reveal navigation.

4 Home page sign in and account access

Home page controls

The home page introduces the product. Its illustrated 18-to-24 employee scenario is an example, not a live view of your business. Illustration labels and decorative cards do not submit changes.

Button or link	What happens	User benefit and example
ComplianceCopilot logo	Opens the home page.	Return to the product introduction.
How it works	Scrolls to the home-page workflow explanation.	Show a new owner the basic process.

Button or link	What happens	User benefit and example
Explore the product	Opens the separate demo workspace.	Inspect features before creating an account.
Sign in	Opens the login form.	Access an existing private workspace.
Get started, Map my next move, Create my workspace	Open account signup.	Start saving real business information under your own account.
Try the working demo, Take a look around first	Open the demo.	Try the app with sample information.

Login signup and recovery controls

Button or link	What happens	User benefit and example
Create account	Validates name, email and matching passwords, creates the account, then proceeds to onboarding when sign-in succeeds.	A new owner starts with a blank business profile rather than inheriting demo records.
Sign in	Checks credentials and opens the dashboard.	Return to your existing business.
Forgot password	Opens recovery.	Request a password reset when you cannot sign in.
Request reset link	Requests a single-use, time-limited password recovery link.	Recover access if recovery email is configured.
Development-only reset link	Appears only when explicitly enabled in local development; opens the reset form without sending email.	Test recovery locally. This is not normal production email delivery.
Update password	Redeems a valid reset token and changes the password. Existing sessions are revoked.	Restore access and require a fresh login.
Back to sign in	Returns to login.	Use the new password after a reset.
Back to home	Returns to the landing page.	Leave the authentication flow.
Explore the separate demo workspace	Opens sample data instead of a private account workspace.	Try the product without entering real business details.

New passwords require at least 12 characters including a letter and a number, subject to the form's validation. A reset link expires after 30 minutes and is single use. If recovery email is not configured and development recovery is disabled, the app reports that limitation; it does not send a message silently.

GitHub credentials and email delivery credentials are not required for normal email-and-password sign-in or Gemini chat. Email configuration is required for the recovery email feature.

5 Onboarding and editing business information

The same four-step form is used to create a business, edit saved facts, review a CSV import and enter a detailed hypothetical scenario. The final button tells you which action you are performing.

Step	Information entered	Why it matters
Business identity	Name, legal business type, industry, workplace type, primary state, city and optional start date.	Identifies the business and helps select relevant conditions and jurisdiction.
Size & locations	Employee count, annual aggregate turnover, equipment investment, financial year, workplace count and staffing by location.	Supports workforce, turnover, classification and workplace screening.
Business activities	Goods/services, taxable supplies, interstate supplies, export plans and optional eligibility answers.	Distinguishes different activity and coverage situations.
Existing compliance	GST registration declaration, other registrations and optional payroll notes.	Separates what the owner declares from what still needs review or supporting records.

Enter currency amounts in rupees. For example, 1800000 means INR 18 lakh. Include the main workplace in the workplace count. For a single workplace, staffing follows the total employee count; multiple workplaces need a sensible allocation within the overall total.

Use Unknown for eligibility questions you cannot establish. The app can then explain the missing information instead of treating an unsupported Yes or No as fact. A business start date is not an account creation date; leave it unrecorded if you do not know it.

Control	What it does	Example
The four step labels	Switch to a step without submitting the form.	Go directly back to Business identity to correct the name.
Continue	Advances to the next step.	Move from identity to employee and turnover details.
Back	Returns to the previous step.	Recheck the workplace count.
State and city selectors	Choose a supported location; changing the primary state refreshes its city choices.	Select Karnataka and Bengaluru.
Number of workplaces or branches	Changes the number of workplace detail rows.	Enter two and describe each workplace.
More details confirm legal eligibility when known	Expands previous EPF/ESI coverage, exemptions and other screening questions.	Record that coverage existed before a fall in headcount.
We export or plan exports	Records export activity in the current form; reveals the FTP-benefit question.	Review the implications of a first export order.
Currently GST registered and registration checkboxes	Update owner declarations in the draft.	Declare an existing EPF registration, then add certificate details separately.
Create my compliance workspace	Validates the completed onboarding form and creates the saved business workspace.	Finish initial setup.
Save business changes	Saves real business facts, reevaluates rules and records meaningful changes.	Record an actual increase from eight to 24 employees.

Control	What it does	Example
Compare detailed plan	Runs the detailed form as a hypothetical comparison.	Preview a new state and activity without changing actual records.
Confirm CSV update	Saves the reviewed imported business profile.	Confirm a corrected employee count from a CSV file.
Cancel	Closes the profile edit without saving its draft.	Abandon an accidental turnover edit.

The form validates numbers and state/city combinations. A repeated unchanged save does not create a new business-change event. Concurrent stale saves can be rejected so that an older tab does not overwrite newer information.

Payroll notes are optional. Avoid employee identifiers. Free-text payroll notes are excluded from the ordinary AI business-profile context; do not assume that writing a note automatically supplies a validated statutory wage base.

6 Shared navigation notifications and account buttons

These controls are available across dashboard sections.

Control	What it does	User benefit and example
Menu icon or Toggle navigation	Opens or closes navigation on smaller screens.	Reach Growth planner on a phone.
Navigation backdrop	Closes the mobile menu.	Return to the active screen.
Ask Copilot in the page header	Opens the assistant section.	Ask for an explanation from anywhere.
Plan your next move in the sidebar	Opens Growth planner.	Preview an expansion idea.
Bell or Open notifications	Opens or closes recent active notices. Its badge counts unread active notices.	Check new deadline or business-change notices.
A notification row	Marks the notice read, then opens its task or Risks & alerts.	Jump from an EPF review notice to its associated action.
Mark all read	Marks notices read.	Clear unread indicators after reviewing them. It does not complete any task.
Initials or Business profile and account menu	Opens account and business actions.	Reach settings, exports or sign out.
Business Profile & Settings	Opens the business profile editor.	Save an actual turnover or team change.
Business change history	Opens recorded business changes and compliance action history.	See what was updated and when.
Download PDF report	Downloads a report for the saved workspace.	Share the current assessment with an adviser.

Control	What it does	User benefit and example
Export business data	Downloads the structured JSON report.	Keep a machine-readable copy for analysis.
Account & security	Opens account settings for a signed-in account.	Change the account display name or start password recovery.
Sign out	Ends the current session and returns home.	Leave a shared computer without deleting business data.
Create a real account	Appears in demo mode and opens signup.	Move from trying sample data to creating a private business.
Edit business profile	Opens the profile form from non-overview sections.	Correct a fact while reviewing a finding.
Dismiss error or X in an error banner	Hides that visible error message.	Clear a reviewed message; it does not repair the underlying failed action.
Close dialog or X in a modal	Closes the dialog. Escape and clicking its outside backdrop also close it.	Leave a task or certificate form. Unsaved form edits are not committed.

Saving inside a dialog and closing it are different. Use its Save, Record or Confirm button before leaving if you want to retain a change.

7 Business overview and its buttons

The overview is a starting screen, not a certification page. Its Action progress percentage is the percentage of active tasks recorded Completed. It is not a probability of legal compliance, a government score or an AI confidence score.

The snapshot shows your business name, location, employee count and yearly turnover. Summary cards show task progress, applicable or potentially applicable laws, priority actions and certificates expiring within 30 days based on recorded expiry dates.

Control	What it opens or changes	Example of usefulness
Update business details	Opens the profile editor.	Record the actual headcount after recruitment.
Action progress card	Opens Tasks & deadlines.	Review which tasks remain before increasing the percentage.
Laws to review card	Opens Applicable laws.	Read the basis for pending legal reviews.
Priority actions card	Opens Risks & alerts.	Focus on high-priority or deadline-risk work first.
Renewals in 30 days card	Opens Registrations & licenses.	Inspect a certificate approaching its entered expiry.
View all under Your next best actions	Opens the complete action list.	See tasks beyond the three-item preview.
A next action row	Opens task details.	Read its required documents and record progress.

Control	What it opens or changes	Example of usefulness
Review business details in the empty action state	Opens the profile form.	Check whether a completed list is based on current facts.
Download report	Downloads the workspace PDF.	Prepare a review meeting.
A row under Dates that matter	Opens that dated task.	Inspect the deadline basis and completion record.
Review obligations when no verified dates exist	Opens Tasks & deadlines.	Add or review a sourced obligation.
Recorded certificates expire within 30 days notice	Opens the certificate register.	Find the exact expiry and reminder preference.
Open full calendar	Opens the calendar view.	See preparation targets and legal dates by month.
Open growth planner	Opens the standard growth simulation.	Compare a proposed business change.
Explore this change on a growth milestone	Opens Growth planner with a hiring, branch or export suggestion prefilled.	Start a review without typing the same idea again.
History or a recent business-change row	Opens Change history.	See an employee-count change and its related impact.
Record a business change	Opens the profile editor.	Record an event that really happened.
All alerts	Opens Risks & alerts.	Review the complete list of issues.
An early-warning row	Opens its task if linked, otherwise Risks & alerts.	Follow the warning to the relevant action.

The workflow strip at the bottom is also clickable. Business profile opens editing; Law check opens Applicable laws; Risks & dates opens Risks & alerts; Tasks & documents opens Tasks & deadlines; AI guidance opens chat; Progress & reports downloads the PDF report.

Example: You see two priority actions and one upcoming renewal. Open the renewal first to confirm its actual expiry. Return to Priority actions, open each task, assign responsibility and set an internal preparation target. Marking a notice read will not reduce unfinished tasks; a real recorded completion is a separate action.

8 Applicable laws and explanations

Each card gives a supported screening outcome, a plain explanation, the first recommended action and missing facts. The current catalogue includes GST, EPF, ESI, POSH, Professional Tax, workplace registration, Udyam/MSME classification, IEC/export review and license-record review.

Outcome shown	Meaning in the app	What to do next
Applies	The screening trigger is established on the supplied facts. Other implementation or individual employee details may remain.	Review the action and remaining conditions.
May apply	Some conditions suggest coverage but require confirmation.	Gather the missing eligibility or exception information.

Outcome shown	Meaning in the app	What to do next
Does not currently apply	The supported trigger is not established on the current facts. Continuing or special duties may still matter.	Keep the profile current and read any caveat.
More information needed	Facts, jurisdiction or source coverage are insufficient for a supported conclusion.	Confirm the missing information rather than treating it as an exemption.

Button or disclosure	What it does	Example
Recheck current facts	Reruns the deterministic evaluation for saved facts.	Refresh screening after reviewing your profile; it does not fetch government registration status.
Legal basis and conditions	Expands rule version, effective/review dates, jurisdiction, exceptions and timing caveats.	Check whether a state-specific source is available.
View official source	Opens the card's linked authority in another tab.	Read the cited provision before taking action.
Explain this result	Opens Copilot with a question about that legal domain.	Ask why EPF is showing for your business.

Example: A business with eight employees plans to hire more. The current card describes the saved business; the Growth planner comparison describes the proposed business. Read both instead of assuming the hypothetical result has already changed the saved finding. POSH committee work is tracked as an organizational task, not a government registration certificate.

9 Tasks and tracking a new obligation

Tasks & deadlines has tabs for Action list, Calendar and Registrations & licenses. Inside Action list, a second choice switches between the normal list and Smart compliance planning.

Control	What it does	Example
Action list tab	Shows recorded tasks and their timing.	Organize unfinished reviews.
Smart compliance planning	Opens the resource-constrained scheduling tool.	Find work that fits the owner's available hours.
Calendar tab	Opens the calendar and timeline.	Inspect dates by month.
Registrations & licenses tab	Opens the certificate register.	Track a license expiry.
Search tasks	Filters tasks by title or legal domain as you type.	Type EPF to find related work.
Task status filter	Filters All, Pending, In progress, Completed, Overdue or Needs review.	Show unfinished reviews before a meeting.
Review task	Opens that task's details, dates, evidence and action history.	See the document checklist before beginning.
Track a dated obligation	Opens a form for a filing, payment or internal action.	Track a specific return period rather than only a general setup task.

Control	What it does	Example
Add obligation for review	Saves the new obligation and its proposed date/reference for review.	Record a GSTR-3B obligation for a named period.

The new obligation form asks for its law/domain, name, filing period or event, preparation target, proposed statutory date and supporting reference. Entering a proposed date does not make it a verified legal deadline. An owner cannot select Overdue as a progress state; the app derives deadline states separately.

Example: Create an obligation called “Review return preparation for the stated period.” Set your own preparation target before the proposed statutory date and include the relevant reference. Review the source and applicability through the appropriate trusted process before relying on an automatic legal-overdue conclusion.

10 Task details progress evidence and completion

Task details combine the reason, suggested records, next steps, completion state and centrally assessed timing. Read the distinction between a preparation target and a verified legal due date before editing or declaring completion.

Progress and responsibility

Control	What it does	Example
Your progress selector	Selects Not started or In progress; completion is handled separately.	Mark document gathering In progress.
More details preparation dates assignment and references	Expands responsibility, internal target, proposed legal date/reference and progress note.	Name your accountant as the responsible person.
Save progress	Saves the progress draft and closes the dialog on success.	Record that payroll documents are being prepared. It does not file a return.
Explain with Copilot	Opens chat with this task's title as context.	Ask for help understanding the task.
Close	Closes task details without submitting another change.	Return to the action list.

Changing a legal date requires another source review. Entering a person's name is not an email invitation or an automatic assignment notification. A progress note is part of your action record; it does not prove work was completed.

Completion and evidence

Control	What it does	Example
Submit completion	Opens the completion form.	Record work you actually performed outside the app.
Amend completion declaration	Appears when a declaration already exists and opens an amendment form.	Correct an action date or clarify the declaration.

Control	What it does	Example
Actual action completion date	Records when the action happened; future dates are rejected.	The action happened on the 28th even if you upload its proof on the 2nd.
Completion declaration	Requires a description of the actual work performed.	State which policy or filing action was completed.
Optional remarks	Adds supporting context.	Explain that an acknowledgement is being collected.
Record completion declaration	Saves the actual date, declaration, remarks and selected evidence.	Record completion truthfully without claiming independent government verification.
Cancel in the completion form	Hides the completion form without submitting it.	Continue gathering details first.
Upload proof	Uploads a private task-linked file for an authenticated business.	Attach a PDF acknowledgement. Accepted types are PDF, PNG, JPEG, WebP and text, up to 2 MB.
Evidence checkbox	Includes or excludes an existing attachment in the next completion submission.	Select the acknowledgement that supports this particular action.
Evidence filename with download arrow	Downloads the file through an authorization-checked endpoint.	Open a saved acknowledgement during a review.
Reopen for further work	Reveals the reopening reason field for a task with a completion declaration.	Begin a correction or additional review.
Reopen and preserve history	Requires a reason of at least ten characters, reopens the task and retains prior completion history.	Explain why an earlier completion needs further work.
Acknowledge for review	Appears for an eligible overdue issue not already acknowledged. Records awareness.	Confirm that you have seen a deadline issue while investigating it. The obligation remains open.

In the sample workspace, actual private evidence upload is replaced by an instruction to use the separate mock deadline demonstration. File selection/upload and the completion declaration are separate actions. Uploading evidence alone does not submit or confirm completion.

Details and action history

Disclosure or link	What it shows	Example
More details possible fine or extra charges	Supported consequences, assumptions and any narrowly supported estimate.	Check whether an amount is actually supported or explicitly unestimated.
Official supporting source	Opens the reference for the displayed consequence/date.	Verify the applicable conditions with an adviser.
Action and deadline history	Shows progress, declarations, date changes, reviews and reopening history.	Explain why a task was reopened after an earlier declaration.

The app distinguishes owner declaration, submitted proof, reviewed proof and confirmed fulfillment. The ordinary owner interface does not include a button to certify independent legal fulfillment or perform the trusted-review stages. A missing upload alone is not treated as proof of a legal breach.

11 Calendar deadline states and warnings

The calendar shows recorded task dates. Preparation targets are internal working dates. Statutory dates require an appropriate source and applicability review before they support a legal-overdue conclusion. Dates are assessed using the app's India-time handling.

Control	What it does	Example
Previous month arrow	Moves back one month and clears the selected day.	Review last month's recorded actions.
Next month arrow	Moves forward one month and clears the selected day.	Plan next month's work.
Today	Returns to the current India-calendar month.	Recover your place after browsing future months.
A day number	Filters the side list to that date. Clicking it again clears the day selection.	Inspect tasks dated on the 15th.
A task in the calendar side list	Opens task details.	Compare its preparation target with its legal date.
Review and resolve in a deadline banner or timeline	Opens the relevant task.	Record the actual action date or investigate the current status. Opening it does not resolve it.

A dot on a day indicates a recorded task date. Absence of a dot does not prove that the business has no obligations that day. Unknown deadlines remain unknown; an internal target being missed does not automatically create a legal fine.

Example: Your preparation target was the 25th and the reviewed legal date was the 30th. Missing the 25th is a planning issue. If an action actually happened on the 28th and its proof was uploaded later, the actual completion date is considered separately from the upload timestamp. Any legal-overdue or late-completion treatment depends on supported date and applicability information.

Monitoring runs when the workspace is opened or updated. A protected job endpoint exists for an externally configured scheduler, but continuous unattended monitoring is not automatically enabled. Dashboard alerts do not imply that email or WhatsApp was sent.

12 Risks alerts and change history

Risks & alerts presents unfinished tasks in priority order, along with other active notices. It can also show a current planning resource shortfall. High, Medium and Low describe the app's review/action priority logic; they are not AI-generated monetary penalties.

Control	What it does	Example
A risk or unfinished issue card	Opens the associated task.	Investigate a high-priority coverage review.

Control	What it does	Example
Review planning constraints	Opens Smart compliance planning when a current analysis has a shortfall or unknown feasibility.	Add available hours or revise preparation cost estimates.
Mark read	Records that a notice has been read.	Remove its unread indicator after review.
Mark unread	Restores an unread marker.	Keep a notice visible for a later review.
Supporting source	Opens the notice's linked authority.	Inspect the basis for the alert.
Change history shortcut or Business change history	Opens actual saved business changes and action history.	Review when turnover or headcount changed.
Update your business in an empty history state	Opens profile editing.	Record the first real business change.

Business history records changed facts, time, actor and associated screening impacts. A hypothetical simulation does not create an actual business-change event. Completion/action history is shown separately within the same history area. Reading or acknowledging a notice does not complete its underlying requirement.

13 Registrations licenses and renewal records

This register stores owner-entered certificates separately from screening findings and tasks. It is useful for keeping a registration number, dates, status and expiry reminder preference in one place.

Control	What it does	Example
Add certificate	Opens an empty certificate form.	Add an actual business license.
An existing certificate row	Opens that record for editing.	Correct a certificate number or expiry date.
Type	Chooses Registration or License.	Distinguish an ongoing registration from an expiring license record.
Associated legal domain	Associates the record with a supported domain. POSH is excluded from this certificate selector.	Associate a GST registration certificate with GST.
Registration date and Actual expiry date if any	Store the dates you enter.	Enter the true license expiry rather than an assumed annual date.
Reminder preference	Chooses 0, 7, 15, 30, 60 or 90 days before expiry.	Request an in-app reminder window of 30 days.
Recorded status	Stores Pending, Active or Expired as an owner-recorded status.	Mark a newly received certificate Active.
Save certificate	Saves the certificate record.	Enable date-based review and reminders on workspace access.
Update declarations	Opens the business profile's registration declarations.	Reconcile a profile checkbox with the certificates you hold.

The visible expiry badge can identify an expired recorded date. Saving an Active status is not government verification. Do not invent an expiry for a registration that has no expiry or requires no renewal. The app specifically notes that Udyam does not require renewal. There is no certificate deletion button in the current form, and no government renewal is submitted by Save certificate.

14 Growth planner workforce and law changes

Use Growth planner before making a business decision. The Workforce & law changes tab compares the proposed facts with your saved business. The Financial impact tab estimates the additional costs from entered figures.

Workforce comparison controls

Control	What it does	Example
Workforce & law changes	Shows the compliance simulation form.	Review hiring, a branch or exports.
New total employees	Sets the planned final workforce, not the number of additional hires.	Eight current employees and a total of 50 means 42 additional people.
Planned yearly turnover	Sets hypothetical annual turnover.	Preview a larger business scale without editing real turnover.
Add a branch selector	Adds one hypothetical workplace in the selected state.	Review a proposed second-state branch. Its city/staffing still need confirmation.
Plan to export	Sets export activity in the scenario.	Preview a first export transaction.
Compare my growth plan	Validates and runs a read-only rule comparison.	View current-versus-planned screening results.
More options activities investment and workplace details	Opens the full profile form inside the scenario.	Model several workplace allocations or equipment investment.
Compare detailed plan	Runs the detailed scenario form.	Compare a state/activity change with explicit facts.
Generate Growth Readiness Plan	Reveals preparation actions, missing information and source references for the simulated results.	Create a checklist before recruitment begins.
Hide readiness plan	Collapses the generated checklist.	Return to the comparison.
Supporting official source or Official source	Opens the reference attached to a result.	Inspect the legal basis behind a proposed review.
Isolated judge example	Opens the separate sample Growth planner.	Demonstrate a change without editing the real business.

The before-and-after panel shows rule versions, jurisdictions, reasons, changed facts and proposed preparation tasks. Proposed tasks in this simulation are not automatically added to your real task list. The comparison preserves missing facts and continuing-coverage considerations.

Example: With eight saved employees, enter 83 as the New total employees to simulate hiring 75 additional people. In chat you can instead say “hire 75 additional employees.” Clear wording prevents confusion

between a new total and an addition. Check EPF, ESI and POSH screening conditions, employee eligibility and workplace allocation rather than treating headcount alone as a complete legal determination.

15 Growth planner financial impact

The financial tool estimates the additional gross wage cost of expansion. It separates gross pay from statutory contribution wage definitions. Existing payroll, recruitment, equipment, professional fees and unsupported contributions are not silently added as if known.

The form asks for planned total employees, gross monthly wage per new hire, budget, start date, projection months and the month hiring begins. Starting wages and budgets are editable examples, not figures read from your accounts. Changing inputs clears the old projection so it is not presented as a current result.

Control	What it does	Example
Financial impact	Opens the projection form.	Compare the budget effect of expansion.
Try 24 employees	Sets planned total to 24 and clears reviewed contribution cohorts.	Start the smaller sample expansion.
Try 50 employees	Sets planned total to 50 and clears reviewed cohorts.	Compare a larger hiring target.
Compare with half the hires starting two months later	Requests a staged-hiring alternative within the projection horizon.	Compare hiring all 16 people now with hiring eight now and eight later.
Reviewed EPF / ESI cohort inputs	Expands optional reviewed contribution assumptions.	Add a confirmed eligible group rather than assuming everyone has the same statutory wages.
Coverage and eligibility confirmation checkbox	Enables adding a reviewed cohort after you confirm the relevant bases and dated parameters.	Record an adviser-reviewed EPF cohort.
Add reviewed cohort for month	Adds or replaces that scheme's cohort for the chosen hiring month.	Include a confirmed group in the employer-cost projection.
Remove next to a cohort	Removes that optional contribution assumption.	Recalculate while eligibility is being reviewed.
Calculate financial impact	Computes the projection, known budget gap and applicable comparison.	See monthly and horizon costs.
Missing information and assumptions	Expands excluded costs and unresolved facts.	Understand why covered known cost is not a full affordability assurance.
Contribution audit by month	Appears when contribution rows exist; shows supported or withheld amounts and their reasons.	Inspect why a future contribution estimate was excluded.
Plan the preparation work	Opens Smart compliance planning.	Allocate people and hours to the compliance work that expansion creates.

Worked example using fictional wages

Assume the saved business has eight people and every new hire is paid INR 25,000 gross per month. Assume all new hires begin in month one of a six-month projection, with no confirmed contribution cohorts.

Planned total	Additional hires	Additional monthly gross wages	Six month gross wages
24	16	INR 400,000	INR 2,400,000
50	42	INR 1,050,000	INR 6,300,000

For the 24-person scenario, a fictional INR 1,000,000 expansion budget is already INR 1,400,000 below the six-month gross cost, before unknown extras. This is useful evidence for staging recruitment or revising the budget. It does not establish that all legal costs are included. Hiring alone does not determine GST liability.

16 Smart compliance planning

Find this under Tasks & deadlines, then Smart compliance planning. The solver searches for a preparation schedule that respects budget, total available work hours, daily staff availability, task dependencies and supported finish constraints. Mandatory tasks and their prerequisites cannot be dropped to make a plan appear affordable.

It supports up to 12 tasks, three people and a 14-day horizon with a bounded exact search. A search limit can leave feasibility unknown; it is not proof that no valid plan exists.

Input controls

Control	What it does	Example
Judge example	Loads the fictional five-task planning example.	Learn the scheduling tool without using real legal dates or costs.
Load my tasks	Loads unfinished, unarchived tasks when there are between one and 12.	Plan actual preparation work. Initial one-hour and zero-cost estimates must be replaced.
Available preparation budget	Sets the maximum budget for selected work.	Enter the amount the owner can actually spend on preparation.
Available work hours in total	Sets a total work-hour cap, separate from each person's daily availability.	Limit the plan to 20 combined hours.
Planning horizon days and Working hours per day	Define the planning time grid within the supported limits.	Plan five days with four working hours per day.
Staff availability and responsibility	Expands names and each person's available hours by day.	Set the accountant unavailable on day two.
Add person	Adds a planning resource, up to three.	Allocate work between owner and accountant. This does not create an account.
Dependencies	Expands prerequisite task checkboxes.	Require document preparation before a coverage review.

Control	What it does	Example
Required checkbox	Marks a task as a hard requirement in the draft. Server validation also enforces confirmed requirements for actual tasks.	Ensure essential preparation cannot be omitted.
Hours and Cost fields	Record task-duration and preparation-cost estimates.	Estimate a three-hour document exercise costing INR 1,500. These are not automatically statutory fees.
Importance field	Scores optional work only; disabled for mandatory tasks.	Prioritize optional awareness work over optional record cleanup.
Finish by	Edits fictional example finish days; actual-task dates are normalized from trusted records.	Explore a fictional day-three finish constraint.
Person selector	Limits the task to one named person or any listed person.	Keep specialist preparation assigned to the accountant.
Find a feasible plan	Runs the mathematical solver.	Produce a schedule or a specific shortfall explanation.

Results and follow-up buttons

Control or result	Meaning and action	Example
Feasible plan	Selected tasks fit the entered hard constraints. Optional-work optimality is reported separately.	Use the proposed staff schedule as a working plan.
Resources cannot satisfy all hard constraints	The solver established infeasibility within the supported problem.	Increase hours or budget rather than quietly deleting required work.
Search limit reached feasibility unknown	Search ended before proving feasibility or infeasibility.	Simplify the planning problem or review its constraints.
Export analysis	Downloads the input and computed result as JSON.	Keep the planning assumptions for an adviser review.
Save analysis for Copilot	Runs/saves a planning snapshot for the business.	Let chat explain the exact computed result later.
Analysis saved	Indicates the current result was saved; the save button is disabled until inputs change.	Avoid confusing an unsaved draft with a saved snapshot.
Explain chosen plan	Appears after save and opens chat with a question about the saved analysis.	Ask why optional tasks were selected or why resources fall short.

Saving an analysis does not complete tasks, save a new headcount, file documents or spend money. Relevant later business/task changes can make the saved analysis stale; rerun it before relying on the schedule. The UI has no general add-custom-task or remove-person button in this planning form; use the loaded task set and supported controls.

Worked scheduling example

In the fictional judge example, three required tasks need INR 6,000 and ten hours in total, with document preparation preceding the later reviews. The five selected tasks can fit within the sample INR 12,000 and 20-hour limits using INR 9,500 and 17 hours. With only INR 2,000 and six hours, the required work is short by INR 4,000 and four hours. These are example preparation estimates, not government charges or legal deadlines.

The owner can use this to identify a resource problem early. The solver provides the schedule and arithmetic; the AI can explain those results but does not invent a better score or alter the constraints.

17 Ask Copilot live chat and every chat control

Ask Copilot provides conversational explanations using the saved business and the active conversation. Authenticated chat reads the authorized workspace on the server. The model has read-only tools for business records, checked legal material, scenarios, supported calculators, gross wage estimates and saved planning analysis. It has no tool to change your business, file forms or complete tasks.

The assistant is intended for Indian SME compliance and related business questions. Clearly unrelated requests should receive a scope explanation. A scope response generated by the live model is still a live response; it does not mean a local fallback was used.

Control or label	What it does or means	Example
Ask a question tab	Opens the conversational assistant.	Ask why a finding matters.
Tax & contribution tools tab	Opens the structured calculators.	Enter explicit invoice or contribution inputs.
Question input	Accepts a question up to 2,000 characters.	Ask “What is my business name?”
Send icon or Enter	Submits the question with business context and relevant conversation history.	Ask what happens if the team grows to 50.
Loading message	Indicates the request is in progress. Sending is disabled while the current request runs.	Wait while Gemini reads a scenario result.
New conversation	Starts a fresh conversation context and preserves older saved messages.	Begin a new topic without clearing all history.
Clear history	Opens a confirmation prompt.	Decide whether to remove business chat messages.
Cancel in the clear prompt	Keeps the history.	Back out of accidental deletion.
Clear chat history	Confirms removal of chat history for that business.	Remove prior chat content without deleting tasks or the business profile.
Retry	Resends a failed question using the same message ID.	Retry a temporary network/provider failure while reducing duplicate-answer risk.
Copy and Copied	Copies the answer text; Copied briefly confirms success.	Share a brief explanation with your adviser.
More details	Appears when a stored/local response has additional detail; expands it.	Read the full older local guidance. It is not a hidden live generation.

Control or label	What it does or means	Example
Legal sources and verification dates	Expands the answer's source metadata and links.	Inspect review dates and jurisdiction.
Review business findings	Opens Applicable laws.	Compare an explanation with the actual screening cards.
Open growth simulator	Appears with a relevant scenario link and opens Growth planner.	Compare the scenario in the structured UI.
What is POSH quick prompt	Sends that question immediately.	Understand a term before planning an action.
Does EPF apply to my company quick prompt	Sends a saved-business applicability question.	Distinguish current facts from a planned expansion.
What if I grow to 50 employees quick prompt	Sends a target-headcount scenario question.	Preview obligations at a new total of 50.
Sign in or Set up business in a recovery error	Opens the appropriate recovery route when the session/workspace needs attention.	Reconnect to the correct account after a session expires.
Offline judge mode checkbox	Available only in the sample workspace. Explicitly selects local algorithm/source guidance rather than live AI. It is off by default.	Demonstrate deterministic features during an internet outage.

A configured label means the server detected a key, not that every future request will succeed. Online AI answer or Online model response identifies a successful live response. Saved local guidance is visibly labeled as not generated by online AI. Old local messages remain old messages; they are not evidence that a newly failed request received an online answer.

Live requests fail explicitly on unavailable credentials, provider outages, authentication problems or quota exhaustion. No local answer is silently substituted. Google daily-quota errors now identify the daily scope and reported request allowance when supplied by the provider.

Useful questions and expected behavior

User asks	What a useful answer should do
What is my company name	Use the current saved name and answer briefly.
How many employees do I have	Use the saved count, not a previous hypothetical total.
When did I start my business	Use the saved start date; say it is not recorded if blank.
I plan to hire 75 additional employees	Add 75 to the saved count, review the scenario and explain the relevant conditions without saving it.
Explain that in simple language	Use the active conversation to simplify the preceding answer.
Does hiring more employees increase GST	Distinguish employee growth from GST turnover/supply/tax treatment.
Explain my saved plan	Read the saved solver result and explain its actual constraints and any staleness.

User asks	What a useful answer should do
Write a cake recipe	Explain that the assistant is designed for SME compliance and related business questions.

The app supplies curated legal material and read-only tools; it is not an unrestricted legal database or a guarantee that current amendments were searched live. Missing wages, rates, eligibility, start dates or jurisdiction should produce clarification rather than invented facts.

18 Tax and contribution calculators

These forms run validated backend arithmetic and show assumptions and source references. They do not require Gemini to produce the calculation. They do not save a filing, update business turnover or send the form's payroll inputs to an online model.

Shared controls

Control	What it does	Example
Calculate GST	Selects the GST form.	Estimate an invoice from explicit amounts and a known/assumed rate.
Estimate Business Income Tax	Selects the supported income-tax estimator.	Review ordinary partnership or LLP income under the supported year.
Calculate Employee Contributions	Selects one-employee EPF/ESI arithmetic.	Review a confirmed contribution wage base.
Calculate estimate	Validates inputs and returns a breakdown or a needs-review result.	Get arithmetic without asking the AI to calculate it.
Export calculation	Downloads the result and its source references as JSON.	Keep the assumptions used in an estimate.
Assumptions inputs and official sources	Expands inputs, remaining credits, assumptions and source references.	Review the basis before using the figure.
An official source link	Opens the cited authority.	Check the relevant provision.

GST controls

The GST form asks for the supply date, registration declaration, tax treatment, supplier state and legal place of supply. The legal place of supply may differ from the customer's address. Rate and HSN/SAC are not guessed from the business industry.

Control	What it does	Example
Ordinary supply, Verified exempt supply, Eligible zero-rated supply under LUT	Selects the entered tax-treatment assumption.	Use zero-rated treatment only when its legal conditions are established.
Supply fields	Record description, amount, rate and optional HSN/SAC.	Enter INR 10,000 and an illustrative 18 percent rate.

Control	What it does	Example
This amount already includes GST	Treats the entered amount as tax-inclusive.	Reverse-calculate a total price rather than adding tax again.
Add another supply	Adds a line, up to 50.	Use separate lines for different supplied items or rates.
Remove supply	Removes that line when more than one exists.	Correct an accidental duplicate.
I verified HSN/SAC and rate	Records classification confirmation for the entered date.	Distinguish a verified rate from an assumption.
Eligible credit and special conditions	Expands tax-head credits and special-scheme questions.	Review eligible IGST/CGST/SGST credits after reconciliation.
I confirmed credit eligibility and required reversals	Confirms that entered credit assumptions were reviewed.	Avoid claiming unsupported input tax credit.
Composition or another special scheme applies	Flags a case that ordinary arithmetic may not support.	Obtain a review result instead of misusing a standard invoice calculation.
Reverse charge applies	Flags reverse-charge treatment for review.	Avoid treating all liabilities as ordinary forward-charge supply tax.
Supply-by-supply breakdown	Expands each line's taxable amount, GST and total.	Check a multi-line invoice.
Credit utilization	Shows supported allocation across tax heads when applicable.	See which credit offset which liability.

Illustrative arithmetic: INR 10,000 excluding GST at an entered 18 percent produces INR 1,800 GST and an INR 11,800 total. Entering INR 11,800 as tax-inclusive at the same assumed rate gives a taxable base of INR 10,000. This demonstrates arithmetic; it does not establish the legally correct rate for a product or service.

Income tax controls

Type of taxpayer chooses Partnership, LLP, Company or Individual. Financial year selects a displayed year. The implemented numerical estimate supports ordinary-income partnerships and LLPs for FY 2025–26, under its stated assumptions. Displaying another choice does not mean that case is supported; unsupported cases return review information.

Enter reconciled taxable income, not turnover. The reviewed-expenses/adjustments checkbox and ordinary-income-only checkbox confirm the estimator's assumptions. The result is annual tax before offsets such as TDS or advance tax and before unsupported interest. The app does not prepare or submit an income tax return.

Employee contribution controls

Choose EPF or ESI and enter the contribution date and a confirmed statutory monthly wage base. The coverage and employee-eligibility checkboxes are separate because establishment coverage does not automatically establish each employee's treatment.

For EPF, the rate-category selector offers the reviewed 12 percent category or 10 percent special category. EPS eligibility reveals a separate EPS wage-base field. For ESI, enter confirmed average daily wages and

use the continuing-period checkbox only when appropriate. The final dated-parameters confirmation covers the wage definition, eligibility, rates and ceiling/options for the selected month.

These are confirmation controls, not proof supplied by the app. Do not substitute gross pay for a statutory wage base without review. One employee is calculated at a time.

Legal knowledge register

Legal knowledge and source register expands curated topic summaries. Filter legal sources searches topic names and keywords. Official source opens the authority; Provision and version expands its provision, publication/effective references, required facts and exceptions. A Needs review record is an information gap, not an automatically established obligation.

19 Reports CSV import and account settings

Exports and imports

Control	What it does	Example
Download PDF report or Download report	Downloads a readable saved-workspace report including supported task/deadline and planning information.	Review the business with an accountant.
Export business data or Export structured JSON	Downloads the structured report data.	Analyze the current assessment in another tool.
CSV template	Downloads a profile CSV based on the current business data.	Prepare a supported profile update in a spreadsheet.
Import business CSV	Reads and validates a selected CSV under 200 KB and opens a review form.	Bring in a corrected profile value.
Confirm CSV update	Commits the reviewed profile through the normal business-save process.	Apply an imported actual headcount change.
Close dialog before confirming CSV	Leaves the import uncommitted.	Abandon an incorrect file.

Importing a CSV is a business-profile update, not a general restoration of all tasks, evidence and history. The JSON report is a structured export; there is no universal JSON restore button in the current UI. Keep downloaded business reports private.

Account settings

Control	What it does	Example
Return to dashboard	Leaves account settings and returns to the workspace.	Continue reviewing tasks.
Full name field	Changes the account display-name draft.	Correct the owner's displayed name.
Save account details	Saves that display name.	Update the account identity label without changing the business name.
Reset password	Opens recovery.	Request a password change through the configured recovery flow.

Control	What it does	Example
Sign out	Ends the active session.	Protect access on a shared device.

Email is displayed as account information; this settings form does not include an email-change or business-deletion button. Changing the account name does not rename the business profile.

20 Demo controls and the judge walkthrough

Sample workspaces are separate from private signed-in data. Sample edits are stored in the browser and may remain until reset. Changing browser, clearing browser storage or switching samples can change what sample information you see.

Control	What it does	Example
Business sample selector	Switches between the hackathon growth story, small IT services, manufacturing and interstate-expansion samples.	Demonstrate a different scenario without editing a real company.
Reset this demo	Resets only the selected browser-local sample.	Start the eight-employee story again.
Open isolated deadline demo	Opens the separate fictional deadline demonstration.	Explain overdue and actual completion behavior.
Round-two judge walkthrough run without Gemini	Expands the offline mathematics demonstration within sample Growth planner.	Present the algorithm when the AI service is unavailable.
Run the complete offline demonstration	Calculates the isolated 24/50 employee wage examples and feasible/infeasible sample schedules.	Show what remains functional without an AI key.
Read measured benchmark	Opens the static benchmark report in another tab.	Review the published measurements and their limitations. It does not rerun a benchmark.

Isolated deadline demonstration buttons

Control	What it does	Example
Fictional obligation selector	Chooses the GSTR-3B nil-central-tax fixture or POSH example.	Compare a supported fictional fee formula with a case that has no numeric penalty estimate.
Simulated legal deadline and Simulated current date	Set fictional dates in the demonstration.	Move the demonstration past its sample deadline.
Run deadline evaluation	Evaluates that fictional scenario without saving it to your business.	Show the overdue-state explanation.
Verified formula sources and conditions	Expands the demonstration's references and conditions.	Explain the narrow scope of its example calculation.

Control	What it does	Example
Review and resolve	Moves focus to the mock completion date field.	Continue the demonstration; it does not itself resolve the task.
Actual action completion date simulation	Records the hypothetical day work happened.	Show an on-time action with later proof submission.
Include a mock acknowledgement	Adds a fictional supporting record when submitting mock completion.	Demonstrate the difference between action and upload dates.
Submit mock completion	Recalculates the fictional scenario with the selected completion facts.	Explain completion states without uploading a real document.

These demonstrations do not change the computer clock, real legal calendar, real task list or real business profile. Their wages, costs, finish dates and mock evidence are explicitly fictional. The round-two offline explanation is algorithmic and labeled accordingly; it is not presented as a Gemini response.

21 A practical day in the app

Example one planning a recruitment drive

1. Open Business overview and confirm the saved employee count is eight.
2. Open Growth planner and enter a New total employees value of 83 to model 75 additional hires.
3. Select Compare my growth plan. Read the before-and-after findings and missing employee/workplace details.
4. Select Generate Growth Readiness Plan and collect the suggested records.
5. Open Financial impact. Enter reviewed wages, a realistic budget and the hiring month, then Calculate financial impact.
6. Open Tasks & deadlines and Smart compliance planning to schedule preparation work within available time and budget. Replace starter estimates before relying on them.
7. Save the analysis if you want Copilot to explain the exact schedule. Ask a follow-up in simple language.
8. Only after recruitment actually changes the business, use Business Profile & Settings and Save business changes. Record actual progress and completion separately.

This helps an owner discover preparation and budget gaps before committing to growth. It does not recruit workers, change government registrations or pay contributions automatically.

Example two managing a certificate expiry

1. Open Registrations & licenses and select Add certificate.
2. Enter the actual certificate name, number and expiry, then choose a reminder window and Save certificate.
3. Review the overview's renewal count and in-app notices as the recorded expiry approaches.
4. Complete the real renewal process outside the app.
5. Edit the certificate record to reflect the new actual dates and record any associated task action.

The benefit is visibility and follow-through. The reminder is based on entered records, not live verification of a government portal or automatic email delivery.

Example three reviewing a deadline issue

1. Select Review and resolve in the deadline banner.
2. Read the verified/proposed date distinction and check the actual action status.
3. Use Acknowledge for review if appropriate while investigating; the obligation remains open.
4. If the action was performed, submit its actual completion date and a truthful declaration with suitable evidence.
5. Read Action and deadline history to understand what was recorded and what still needs trusted review.

This avoids treating a late upload as automatically equivalent to a late filing, while preserving meaningful dates and prior history.

22 Troubleshooting and operating limits

Situation	What it means	Next useful action
Business not found or access denied	The requested business is unavailable to the current authenticated account, or the page is stale.	Follow the sign-in/workspace recovery shown by chat and confirm the correct account. Do not assume it is an AI-key issue.
Server key is not configured	The running server cannot see the selected provider's key.	Ask the operator to check the private server environment and restart the correct app instance.
Gemini unavailable or HTTP 503	A live provider request failed or the service is overloaded.	Retry later. The app does not silently substitute a local reply.
Daily quota exhausted or HTTP 429 from provider	Google reports an exhausted project/model allowance.	Inspect Google AI Studio usage/billing or wait for the quota reset. Replacing a key alone does not increase project quota.
Local guidance shown	An older local message or explicitly selected offline sample mode is being displayed.	Read its provenance label. Keep offline mode unchecked when testing live sample chat.
No start date recorded	The business profile does not contain that date.	Enter the real date if known; the AI should not invent it.
No verified legal dates	No suitably reviewed dates exist in the current records.	Review sourced obligations; do not interpret the blank view as no legal duties.
Calculator says review needed	One or more required facts, supported dates or supported treatments are missing.	Supply reviewed inputs or seek an adviser. Do not force an estimate by guessing confirmation answers.
Planner says infeasible	Entered hard requirements do not fit supported constraints.	Review real resources and assumptions without removing confirmed mandatory work.
Planner says feasibility unknown	Its bounded search did not prove an answer.	Simplify or review the problem; do not describe this as proven infeasibility.

Situation	What it means	Next useful action
Stale planning analysis	Relevant workspace information changed since the snapshot.	Load/review inputs and rerun the plan.
Evidence upload fails	File size/type/signature, authentication or ownership checks may have failed.	Use an accepted file under 2 MB in the correct private task.
Password email unavailable	Recovery delivery has not been configured or failed.	Contact the operator; Gemini chat does not provide recovery email.

The app does not submit statutory filings, pay government amounts, register a business, verify every uploaded document, guarantee avoidance of notices or certify legal compliance. No user-facing button silently performs any of those operations. Missing jurisdiction and source coverage are shown as review gaps.

23 Technical overview for demonstrations

The interface uses Next.js App Router, TypeScript, React and Tailwind CSS with reusable UI components. The Next.js server also hosts the application API routes. NextAuth handles authenticated sessions. Current local persistence uses the SQLite adapter; a PostgreSQL path through Prisma is available in the repository. Prisma is a database toolkit that lets the server work with structured database models; it is not the AI model or the chat engine.

The business database, uploaded evidence and rebuildable public legal-source index serve different purposes. The business database retains account/workspace data; the legal index supports public legal material. The live Gemini key is server-side configuration and must never be included in frontend code, exports or Git.

Module	Its job	Does it require the live AI service
Authentication and workspace storage	Own-account access, saved facts and record isolation.	No
Rule screening and change comparison	Versioned findings, missing facts and before-and-after explanations.	No
Deadline monitoring	Assess supported dates and completion records on access/update.	No
Calculators and finance projection	Validated arithmetic with assumptions and unsupported cases withheld.	No
Smart planning solver	Search for a constrained preparation schedule.	No
Gemini conversational assistant	Generate short, contextual answers and use authorized read-only tools.	Yes
Explicit offline sample guidance	Limited labeled demonstration guidance.	No
Optional password recovery delivery	Send reset email through the separately configured mail provider.	No Gemini dependency; its own delivery setup is required.

The current public interface does not include an administrator rule editor, automatic government-portal integration, team invitation flow, continuous scheduler setup screen, payment screen or production deployment wizard. Document these as possible future work rather than completed buttons.

24 Quick operating checklist

Before relying on an assessment, confirm that the saved company, location, headcount, turnover and activity are current. Read missing facts and source dates. Distinguish owner declarations from independently reviewed facts.

Before saving anything, identify whether the button says Save business changes, Record completion declaration, Save certificate or Save analysis for Copilot. Each saves a different kind of record. Compare, Calculate and Find a feasible plan produce analysis; they do not update actual business facts.

Before presenting the product, decide whether you are showing a private business, a browser-local sample, an offline algorithm walkthrough or a live Gemini conversation. Keep those modes clearly labeled. Use a New conversation for a fresh chat topic, and preserve real account data while demonstrating hypothetical growth.

This guide was checked against the current dashboard, forms, task editor, calculators, growth tools, planning solver interface, demonstrations, authentication flow and chat implementation. It is a functional guide to this app version, not an independently updated statement of Indian law. No app code or business data was changed to prepare it.
